

# A cautionary tale about ameliorating parameterizations offline: Improved water fluxes degrades near surface temperature

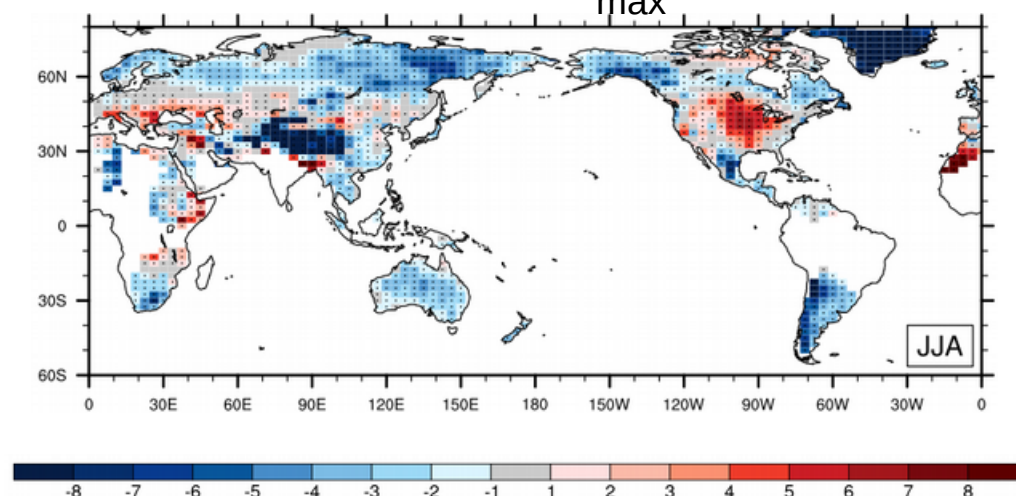

Mark Decker  
Andy Pitman, Anna Ukkola, Dani Or

## Ruth Lorenz found:

Mean ET

Mean  $T_{\max}$

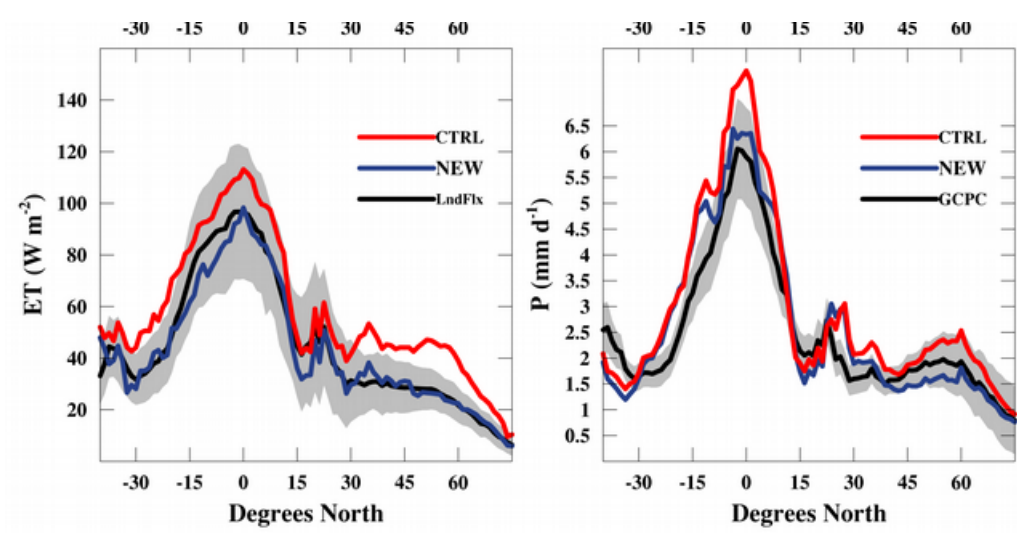

$T_{\max}$  too cold  
ET too high  
DTR much too small

## Model improvements:

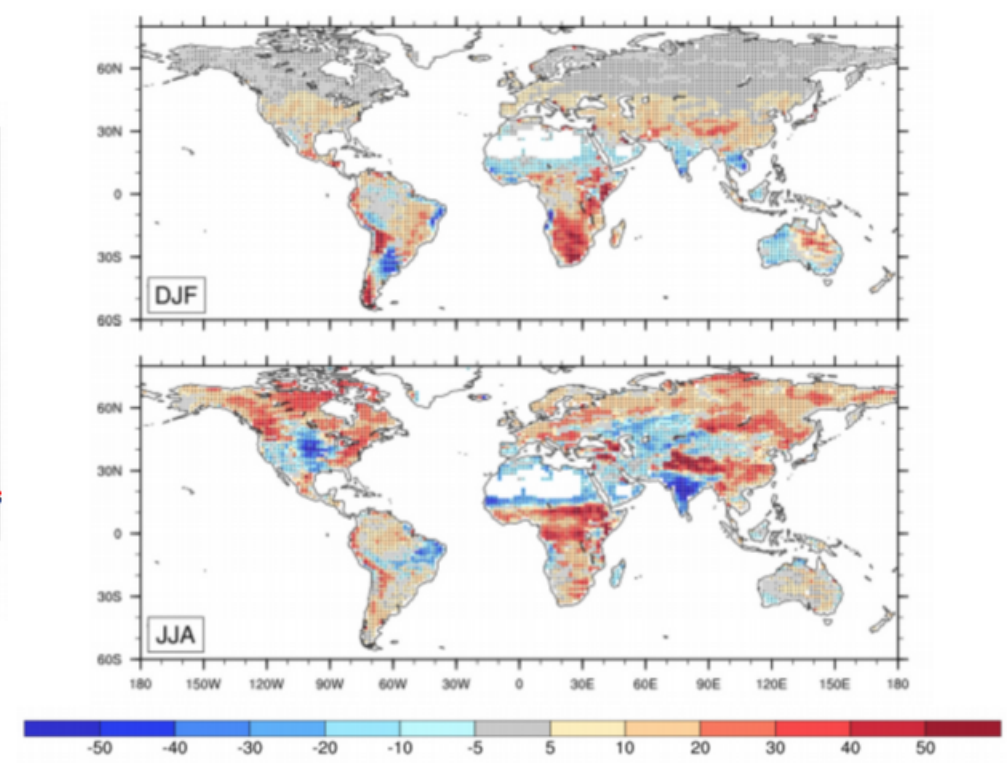

Incorporate subgrid scale parameterizations  
physics into the soil evaporation parameterization

## Zonal P and ET

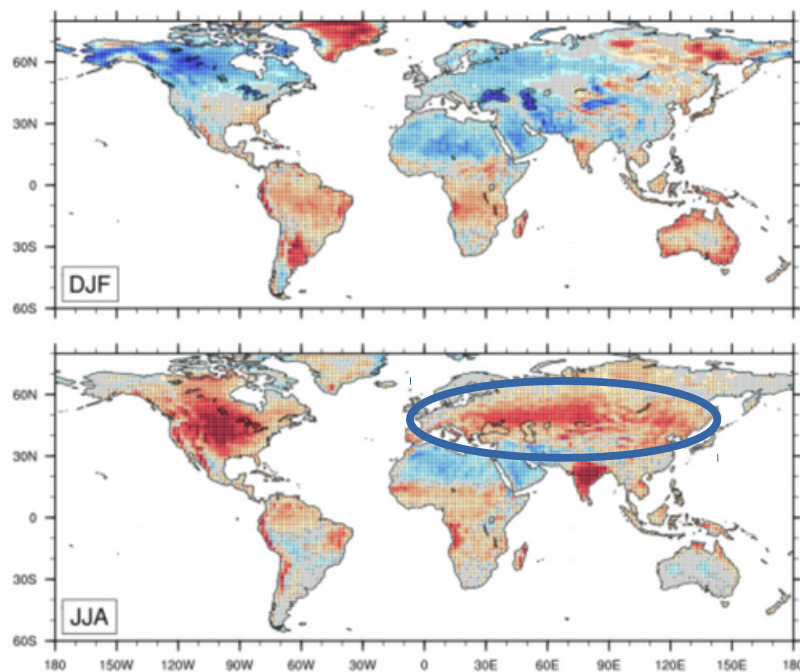

## Mean ET

Mean P and ET within observational uncertainty. Great!

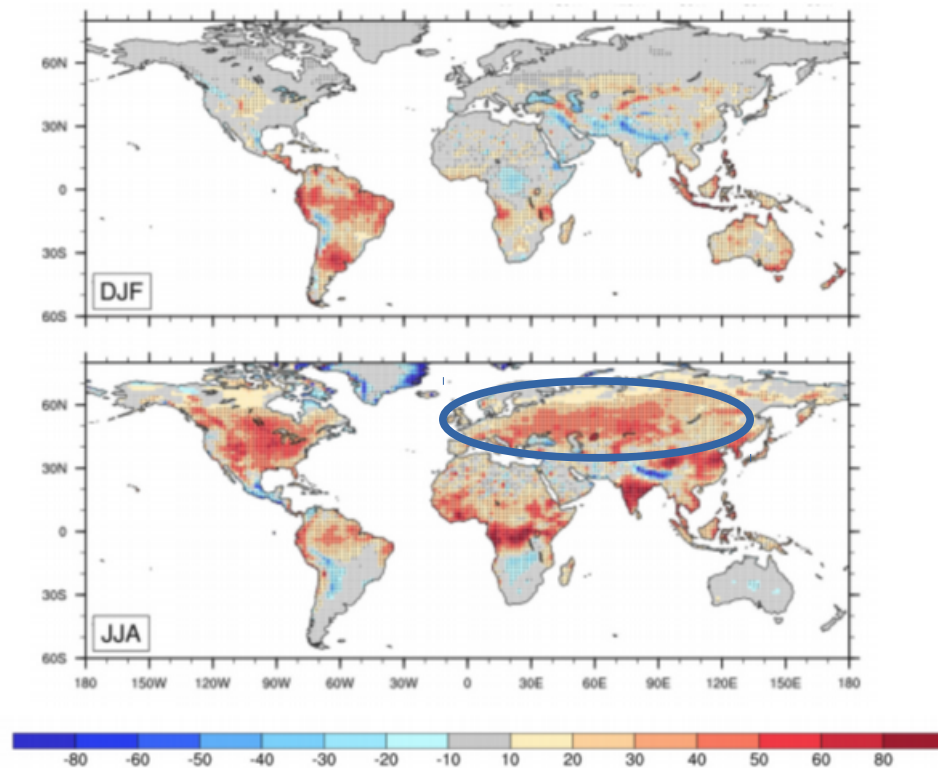

Mean  $T_{2m}$  bias (ERA-Int)

**5K!**

Mean  $SW_{down}$  bias (CERES)

**40 Wm<sup>-2</sup> !**

## Conclusion

**CABLE exhibits large positive ET bias:**

**Offline point scale simulations**

**Offline global simulations**

**Online simulations**

**Readily fixable by addressing the soil evaporation and hydrological parameterizations**

**Positive ET bias needed in JJA for better temperature simulations**

**Ongoing:**

**Test with um10.6**

**What about JULES?**

**What does this mean for addressing changes in hydrological cycle with ACCESS?**
